Concerns of each component in my File task manager application.

The first concern identified was when creating or updating a file, the priority and active or inactive field could be incorrectly created. To combat this I used a try and except to catch any errors as well as hard coding the inputs required from the user.

Also for the application to be functional there had to be a way for the user to communicate and input the functions they wanted to execute. So I remembered a previous task that utilises a while true statement to create a menu list, and when specific numbers were input by the user this would execute specific functions from the application.

Other concerns included privilege concerns and not wanting just anyone to have access to the delete function.

The other functions such as read all was not really a concern.
